Feral hog cause millions of dollars in agricultural and property damage each year throughout the US. The most effective method to remove feral hogs is to remove the sounder from an area at one time.

The Raptor Remote Trigger system provides an effective solution to your feral hog problem. The systems incorporates a remotely monitored wireless camera which alerts the user in real-time when an animal has entered the trap.

Simply connect the Remote Trigger system's solenoid to your existing pen and baiting system. The ability of a user to determine when to trigger the trap can be a major advantage over the much more indiscriminate manually activated animal traps or standard animal-triggered live traps.

Options include wireless motion sensors and solar charging for long-term field deployments.
