The UndercoverEye™ Raptor Cellular/WiFi surveillance camera system is an unattended camera specifically designed for real-time photo notification. Upon motion detection the PixController UndercoverEye™ Raptor system will send you a photo via a cellular or WiFi link within 30 seconds of the trigger event leaving time to apprehend the suspect onsite.

Sends to multiple email address/cell phones and include a text message with your photo such as a GPS position (optional) and location information and system battery level. System includes a built-in Mini-DVR recorder to record full motion video in MPEG4 format to an included SD media card.

System is triggered by the PixController wireless sensors. Connect any standard 12V video camera. Includes external charging port for external batteries or solar charging for long-term field deployment.
